Research Projects ____

A computational approach to repurpose drugs against infectious diseases - NIH funded

- Mentors: Dr. Janani Ravi and Dr. Arjun Krishnan
- Reconciled multiple connectivity-based methods for drug repurposing and published the work in Briefings in Bioinformatics.
- Design and develop a computational framework for host-directed gene expression-based drug repurposing in infectious diseases.
- Write custom R scripts to programmatically obtain and uniformly process disease and drug gene expression data (for both microarray and RNA-seq data) from public gene expression databases e.g. GEO, ARCHS4, LINCS, CMap.
- Perform differential expression analyses using limma, DEseq2 packages to construct disease signatures.
- Integrate the reconciled multiple connectivity-based metrics in Samart, Tuyishime, et al. 2021. to identify efficacious drug candidates for tuberculosis.

Modeling the START transition in the budding yeast cell cycle

- Mentor: Dr. Janani Ravi
- Contribute to the mathematical model built on over 100 differential equations and 200 parameters to represent the critical decision point in cell division of the budding yeast cell cycle.
- · Simulate about 150 mutant phenotypes using SBML (Systems Biology Markup Language) for model manipulation and PET (the Parameter Estimation Toolkit) for model simulations with our new parameter set.
- · Generate all the final cartoon depictions of the cell cycle model, simulation plots, and tables and finalize the manuscript for submission (Ravi, Samart, et al.,; will be submitted to bioRxiv by Dec 2021).
